Additional set of gaskets for the oil filter element HU 925/4 x

The MANN-FILTER oil filter element HU 925/4 x is supplied with a black O-ring to the seal housing cover as well as a copper sealing ring.

There are also two small green O-rings at the end of the cover center pipe of the HU 925/4 x. These O-rings seal the oil drainage channel in the oil filter module.

When the housing cover is unscrewed, the drainage channel is uncovered, allowing any oil in the housing to drain into the oil pan and the oil filter element can then be changed easily.

When changing the filter element, the two small green O-rings can be checked for damage and only replaced if necessary.

Available at MANN-FILTER!

The set of two O-rings is available from MANN-FILTER under sales reference DI 007-00.
